

Grazing Management CSP Enhancement

Conservation Practice Job Sheet

- ☐ Improve grazing management by limiting supplemental feeds to <10 lb. of grain/animal/day.

The purpose of this enhancement is to minimize the amount of grain fed to livestock. One of the most logical goals of economically sustainable livestock production in Pennsylvania is not to provide nutritional inputs, such as harvested winter feeds and supplements, unless they are necessary. Therefore, the first goal of a manager should be to match the nutritional demands to the forage resources available.

Use the following table for documentation. An example is provided to assist you.

Animal Type	Animal #	Lbs of feed per day/head	Began grain supplemented	Ended grain supplemented
beef	40	8	11/18/2005	3/18/2006
